

6.0 Release Notes

Prepared - 6/15/08

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
38489	Feature Enhancement	5.0	API & CLI	Enhancement to the CLI to make it work with HTTPS protocol	This enhancement has enabled the CLI running under Perl 5.8.8 to run within the HTTPS protocol.
51716	Feature Enhancement	5.2	API & CLI	The * Ask at runtime * feature now works with run_report api	This feature allows reports to be configured with the * Ask at Runtime * filter. When a user runs a report with one or more filters configured in this way, they are asked to supply the appropriate values.
55133	Feature Enhancement	5.2.2	API & CLI	Added ability for API to use a Detailed Report layout, based on the behavior setting named REPORT_DTL_ITEM_DATA_LAYOUT	The functions GET, SEARCH, and RUN_REPORT in the API are now sensitive to the behavior setting named REPORT_DTL_ITEM_DATA_LAYOUT. The choice of the layout used now depends on the business area and project of the returned data.
60131	Feature Enhancement	5.2.2	API & CLI	Improved support integrating ExtraView with data warehouses by an extension of the evhist command	The evhist command has been extended to allow the definition of a field list to be exported from ExtraView, and to allow all updates of records in the timeframe specified to be output, as opposed to only seeing the last update during the period.
41288	Feature Enhancement	N/A	Add & Edit	New Save and Continue Editing function	Controlled by a new security permission key named PR_RESOLUTION.SAVE_AND_CONT_BUTTON, users will optionally see a button that allows them to save their current edit session, and to continue editing the edit.
54822	Feature Enhancement	5.2.2	Add & Edit	Ability to set the parameters to an External Link on a "Display as URL" field	There is now a new, optional method in the UserCustomJavaScript.js file. This method is named userJavaScriptRemoteLink and may be used to alter the parameters of the call that opens the window to a "Display as URL" link. Using this, the administrator may set any of the parameters of the window.open call for the new window.
57148	Feature Enhancement	6.0	Add & Edit	Highlight the selected values in multivalue lists	When a user sees any selected value in a multivalued list field, they will also see that the background color of the selected entry complements the selection character (normally a character). This provides additional clarity of the selected values in a long list.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
57245	Feature Enhancement	6.0	Add & Edit	New option to create a search layout within an add or edit screen	<p>It is often useful to set up a search operation within an add or edit screen, allowing the user to search for some information to include within the current record being created or updated. For example, you may present several fields related to a customer record, and allow the user to enter any known information, such as a telephone number or email address. ExtraView will then search the customer records for all matches and allow the user to select the appropriate record from the returned records.</p> <p>This can now be achieved with the combination of a layout and a business rule and without any custom programming.</p>
59380	Feature Enhancement	5.2.3	Add & Edit	Ability to ignore non-qualified email addresses in the mailing list	<p>A new behavior setting named EMAIL_ALLOW_UNQUAL_ADDRESSES allows the use of unqualified email addresses to be used, where the domain does not need to be entered, but is supplied by the mail server.</p> <p>For this to work, BatchMail must be configured to use an SMTP server that recognizes these unqualified addresses</p>
25692	Feature Enhancement	4.2.2.7.1	Administration	Return administrators to the same place on the administration list screens, after they have updated an item on the list	<p>Once a user has set up a sort order or other filter on an administration screen, then drill down to update an item, then return to the initial list, the sort order and filters will have been remembered. This means they do not need to redo the sort or filters at that time.</p>
26814	Feature Enhancement	4.2.2.12	Administration	Ability to use embedded layouts on Detailed Report, Email and History layouts	<p>Previously, embedded layouts could only be placed within add and edit layouts. This ability has been extended to work with Detailed Reports, Email layouts and History layouts, simplifying the creation of complex layouts.</p>
54916	Feature Enhancement	N/A	Administration	Simplify site upgrades with custom image and custom stylesheet sets	<p>The file directory structure of images has been altered to simplify upgrades for sites that have custom image sets or custom stylesheets. This is achieved by splitting the navigation bar images and the remaining images and stylesheets into two separate directories. Following this upgrade, changes to these directories should be non-existent or minimal, even when new images are introduced into ExtraView's base set.</p>

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
55091	Feature Enhancement	N/A	Administration	The setting of security permissions can now be made from the data dictionary and and edit screens	There is a new button on the data dictionary add and edit field screens that leads to a popup where the administrator can set the field's security permissions, across all the roles, business areas and projects that he has permission to update.
55092	Feature Enhancement	N/A	Administration	Allow the setting of security permissions from the layout editor	There is a new button by each field within the layout editor that leads to a popup where the administrator can set the field's security permissions, across all the roles, business areas and projects that he has permission to update.
56022	Feature Enhancement	5.2.1	Administration	Easier deletion of fields in the data dictionary, with no issue data	Deleting fields from the data dictionary would fail if the field had any associated metadata as well as item data. To simplify this operation, ExtraView will remove any metadata associated with the field and delete the field. However, if any item data exists, the fields will not be able to be deleted.
56338	Feature Enhancement	5.2.3	Administration	SUPPRESS_STANDARD_EMAIL_LIST is now a behavior setting as opposed to being a setting in the Configuration.properties file	Customers who have this setting set to YES or TRUE in their Configuration.properties file need to set it in the behavior setting after upgrading to 6.0
57355	Feature Enhancement	5.2	Administration	New management mechanism to administer user's Company Names	The Company Name field on user maintenance screens may be populated with the values from a User Defined Field with a display type of list. This provides a mechanism to select company names from a list as opposed to enter them manually, thereby eliminating the risk of misspelling these for different users. The UDF may also be used as a regular field on add and edit screens as well as being used on reports.
57538	Feature Enhancement	6.0	Administration	The area_id and the project_id are now visible on their respective maintenance screens	This facilitates administration for users who create custom code, by allowing them to see these ID values without needing to run SQL queries on the database.
59382	Feature Enhancement	5.2.3	Administration	Updating a data dictionary entry on a large system took almost half a minute	The code to perform this task has been revised to speed up the operation.
59738	Feature Enhancement	5.2	Administration	New management mechanism to administer user's Company Names	The Company Name field on user maintenance screens may be populated with the values from a User Defined Field with a display type of list. This provides a mechanism to select company names from a list as opposed to enter them manually, thereby eliminating the risk of misspelling these for different users. The UDF may also be used as a regular field on add and edit screens as well as being used on reports.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
58085	Feature Enhancement	6.0	Allowed Values	New Ajax method to deliver allowed values to the Add and Edit screens	This complements the JavaScript refresh and Page refresh logic to populate the child value in an allowed value relationship when the parent is changed, by using Ajax. This is intended to replace the Page refresh method which will be deprecated at some future date. The key advantage is that the population of child allowed values takes place without the need for a screen refresh, making it much faster and much more user friendly for allowed values with many parent and child combinations.
60926	Feature Enhancement	5.2.3.4	Allowed Values	Allowed Value Relationship with multiple parents.	<p>The administrator may create two allowed value relationships with different fields as the parent, and the same child field. When you create this scenario you can individually populate the allowed children for each of the parents in their respective allowed value lists. When you include the two parent fields and the child field on the same add or edit screen, then the children that are visible will be those that have common parents. If a child value only has one of the two parent fields as an allowed value, the child will not be displayed and it is not a valid selection.</p> <p>If only one parent and the child exists on the add or edit screen, then this combination will work correctly as the simpler single-parent allowed value combination. The parent and child fields used for this combination must all be enumerated lists with a display type of List, Popup, Tab, Checkbox, or Radio button. User display types are not supported at this time.</p>
53574	Feature Enhancement	5.2.2	Charts	GUI for chart creation separates which statuses are to appear on the chart from the use of status as a filter	<p>Until this version, selecting a status value or values for a chart implied that the value or values would both be used to control which statuses were to appear on the chart, and to signify the use of the status value or values as a filter for the chart.</p> <p>There are now separate status lists, one to be used to select which values will appear on the chart, and one which allows the values of status to be selected as filters.</p>
53795	Feature Enhancement	5.2.2	General code issues	Security permissions now enables on the Project field as well as on the Area field	There are now a new series of security permission keys allowing the administrator to set up permissions to Projects as well as to Business Areas. This gives much more control over access to individual tracking projects in large sites.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
53796	Feature Enhancement	5.2.2	General code issues	Fields are now able to be created by area/project and are inheritable	This is a major enhancement that allows fields to be created and maintained by business area and project as opposed to always being global. This allows sites with many areas/projects to restrict fields to those users with permission to see the relevant areas and projects.
57030	Feature Enhancement	6.0	General code issues	Renaming of the "Master Area" as the "Global Area"	To provide better consistency of nomenclature the Master Area has been renamed as the Global Area, and the default project within the Global Area has been renamed as the Master Project.
59926	Feature Enhancement	N/A	General code issues	AREA and PROJECT fields now have names as well as titles and ID's	To complement the AREA_ID and PROJECT_ID fields there is now an AREA and PROJECT name field associated with each Business Area and Project. This makes user custom programming a little simpler, working with names, rather than ID's
57660	Feature Enhancement	5.2.3	LDAP	Ability to do an LDAP UPSERT when SSO is enabled	This removes the limitation that LDAP upserts could only take place when SSO was not enabled.
59491	Feature Enhancement	5.2.3	LDAP	DEFAULT_USER_ROLE behavior setting doesn't work	There is a new behavior setting named LDAP_UPSERT_DEFAULT_USER_ROLE. This allows the setting of a user's role via LDAP to be different from the standard LIMITED_USER_ROLE.
57567	Feature Enhancement	6.0	Layout Editor	Security permissions may be set from within the layout editor	This speeds up the creation of new fields and helps administer existing fields by giving access to a field's security permissions from a button on the data dictionary add and edit screens
59086	Feature Enhancement	N/A	Layout Editor	New Layout Cell Attributes to provide additional control over the formatting of fields on layouts	There are three new layout cell attributes to provide additional control over the formatting and presentation of fields on add and edit layouts. These are: VALUE_TAG_DEFAULT - Allows the setting of a style or other attribute on the value of a field LABEL_TAG_DEFAULT - Allows the setting of a style or other attribute on the label of a field VALUE_TAG_DEFAULT - Sets a default style for the entire system for the values on layouts
59088	Feature Enhancement	N/A	Layout Editor	Provided better display of long titles in the layout editor and report editor	When titles longer than the width of the screen populated lists in the layout and report editors, the screen scrolled horizontally, making it difficult to select the field. Long titles are now truncated to a reasonable width, although they will render completely on the appropriate add and edit screens as well as reports.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
48844	Feature Enhancement	5.1	Mass Update	Mass Update - Issue Update and Change History	The mass update operation has been enhanced to support the addition of entries into a log area field type. When a log area (or comments) type field is included in the mass update, a new entry is inserted into the field, as opposed to any existing entries being modified.
55850	Feature Enhancement	5.2.2	Mass Update	Extend the Record Selector Feature to Mass Update	When records are selected with the Record Selector, just those selected are passed to the Mass Update utility when it is invoked from a report.
57347	Feature Enhancement	6.0	Notification	Email notifications are now sent in the recipient's locale	Previously, all notifications were sent in the locale of the sender. Now an email notification is generated for each locale of each user who is to receive the mail, and the individual user will receive an email in that locale.
59260	Feature Enhancement	5.2.3	Perforce Integration	New ability to use Perforce Daemon in an SSL environment	SSL is now supported for the EVP4D.
52563	Feature Enhancement	5.2.1	Performance	When starting ExtraView the clean up outstanding spilled sessions happens much faster	Previously, on a large system, it could take considerable time for the ExtraView server to start, as time was taken to clean out old session data which could no longer be used or reached. This process has been improved considerably, allowing the server to be available much faster.
52873	Feature Enhancement	5.2	Performance	Added governor to query execution to prevent runaway queries	A new behavior setting named QUERY_TIMEOUT_SECONDS controls the maximum time that any query may run in the database. This counters the infrequent occasions when a poorly formed query is created, or ExtraView encounters a problem with the database or its optimizer.
53289	Feature Enhancement	5.2	Performance	Table Cleaner could take a long time to clean large layout tables after an XML metadata import	This is a performance improvement that speeds the process of importing metadata into an installation. Part of the process involved examining and "cleaning" the data in all rows of the layout and its associated tables. This process has been speeded up.
55309	Feature Enhancement	N/A	Performance	The advanced query mode has been reworked, eliminating screen refreshes	The advanced query mode has been updated, eliminating all screen refreshes. This makes it much faster to create a set of advanced filters. At the same time, new filters can be created in the middle of an existing set, and existing filters can be removed in a simpler way.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
53602	Feature Enhancement	5.2	Relationships	New ability to sort and resort on Related Issues	Within the add and edit screens, the related issue display is now sortable, by clicking on the titles of the column headings. No screen refresh is involved in the operation, as Ajax is used to perform the operation.
54384	Feature Enhancement	5.2.2	Relationships	The Administration "Manage Relationship Groups" screen was too slow with a large number of related issues	The entire screen has been reworked to provide a more scalable GUI, with Ajax being used to retrieve data as it's required, as opposed to always displaying all data when the user first enters the screen.
57972	Feature Enhancement	6.0	Relationships	New ability to dynamically select which relationship group to use for a related issue display on edit screen	This is a new behavior setting which contains the name of a user defined field with a display type of list. This UDF is used to maintain a list of the names of relationship group for related issue display. The UDF is maintained by ExtraView as relationship groups are created or deleted. The UDF can also be aliased by other UDF's to provide an unlimited number of fields that can be used to identify the relationship group names to support multiple related issue displays on a single edit screen.
59163	Feature Enhancement	5.2.3.2	Relationships	Enhanced relationship group field to allow multiple item ID's to be entered on one pass	On text fields that have layout element attributes for relationship set up such that the field contents are read in and related to the current issue, you can type in multiple ITEM_ID values, separated by semi-colons, and all the items will be related to the current one when the issue is submitted/updated.
53256	Feature Enhancement	5.1.1	Rules Engine	New ability to write rules to set the value of "Include Customers/Guests in notification"	New feature supports a EMAIL_IGNORE_GROUP entry, where a value beginning in Y or y will set the email customer/guest checkbox and the Generate email checkboxes "Checked".
53797	Feature Enhancement	5.2.2	Rules Engine	Business rules are now inheritable to a business area	This feature allows the administrator to enter business rules either as global or to only have a scope within a single business area. If the administrator does not have permission to view or update information within a business area, then they will not be able to view or alter the rules within that area. For more granular control, the administrator will still be able to enter rules that set the scope of a rule to just a single project within the business area. Rules within the business area of an issue are triggered first, then the global rules are executed last, ensuring that any rules set by the global administrator are always triggered.
53799	Feature Enhancement	5.2.2	Rules Engine	Repeating rows may be created with business rules	This new feature allows the generation of repeating rows with business rules.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
22776	Feature Enhancement	5.2.3	Search / Report	Implemented indexed text search capability for both Oracle and SQL/Server	This major enhancement allows the administrator to configure the database such that all keyword searches can take advantage of the text indexing capability within Oracle and SQL Server. This requires a knowledgeable administrator to decide which fields will be indexed and how often to run the background indexing tasks. At the end of the day, this optional feature provides a much speedier method to search for keywords in text and attachments on large databases. It also provides for the searching of Adobe PDF files stored as attachments in the database.
53800	Feature Enhancement	5.2.2	Search / Report	New Quickedit mode for reports	This is a major new feature and enhancement to ExtraView. A "Quickedit" button may be placed on any column report or on a Quicklist layout. When the user clicks the button against any issue, the issue is immediately editable, without any need to go to the edit screen of the issue. Only the fields displayed on the report are presented in edit mode, and all business rules and workflow rules are still in place. No screen refreshes are involved in the operation - this is a very fast way to interactively review and edit many issues at one time.
55854	Feature Enhancement	N/A	Search / Report	New report output mode option, allowing Adobe PDF's to be created for any report	To complement the existing output options to the browser, Microsoft Word, Microsoft Excel and text, there is a new option to allow any report to be output to the Adobe PDF format.
56047	Feature Enhancement	5.1.2.1	Search / Report	New floating report column - title headers	On column reports and Quicklist reports, when the user scrolls down the screen, the column titles will remain in place at the top of the screen in the browser, clarifying the report output.
58341	Feature Enhancement	N/A	Search / Report	Separated the field selections in column reports, by the type of field	When creating a new column report the user may be presented with a long list of fields. To help select the fields, there is now a row of buttons beneath the list, allowing the user to see just the fields, just the buttons or just the calculated expression fields.
58987	Feature Enhancement	5.2.2	Search / Report	Related Issue Display render width on Detailed Report screen	It was requested to have the related issue display extend to the entire width of the containing table, to make it look more attractive. This has been implemented.
59856	Feature Enhancement	N/A	Search / Report	Users may now create a report showing the data at any point in time	There is a new data dictionary field named HIST_RANGE_END which can be used as a report filter. When a user chooses a date/time as a report filter, the results are displayed as of that date/time.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
55744	Feature Enhancement	5.2.2	User Interface Issues	Overcome Firefox bug where Right-mouse-click Save-as operations when downloading a file did not launch the correct viewer for the file	This enhancement allows users to save file attachments more simply when running within a Mozilla Firefox browser.
57871	Product Bug	5.2.3	API & CLI	The user's license could occasionally expire, even though it was a named rather than concurrent user	This was a rarely encountered bug and has been fixed.
60747	Product Bug	5.2.2	API & CLI	Setting the behavior setting MULTI_RELEASE_XML to YES caused the truncation of repeating row record data in the evget command	This was a bug. Now fixed.
62141	Product Bug	5.2.2	API & CLI	evsearch -c data is delimited differently after changing the value of the behavior setting named MULTI_RELEASE_XML to YES	This problem affected the delimiting of the data returned from the server. This has been fixed to be consistent.
62499	Product Bug	5.2.2	API & CLI	evreport gave error when trying to run a report	One user consistently saw an index out of bounds exception when trying to run a report through the CLI. This was a data related issue that was fixed.
56727	Product Bug	5.2.2.2	Add & Edit	Newly added repeating row fields caused rendering problems and null pointers were seen in the log	This was a bug caused by null values in fields on the layout. The condition that caused this has been fixed.
58601	Product Bug	5.1.1	Add & Edit	Site was unable to delete issues that had attachments	This proved to be a problem on SQL Server database installations only. Issues with attachments can now be deleted successfully.
60111	Product Bug	5.2.3.2	Add & Edit	Error fixed on Edit screen display of multi-valued user fields	The "Error rendering form: see log for details.[null]" message was displayed and a NullPointerException error is recorded in the log when editing an issue with a User-type field that has multiple values/users specified. This condition only happened when the following behavior settings were set as follows: USERNAME_DISPLAY = ID USER_LIST_DISPLAY = POPUP This has been fixed.
60207	Product Bug	5.2.2	Add & Edit	Repeating row Date UDF values did not stay in the correct row within the data	This was a very obscure problem which was only seen after a very infrequent sequence of events. The result was that a date value could shift from one repeating row record to another. This has been repaired.
60438	Product Bug	5.2.3	Add & Edit	In the upgrade to 5.2.3 the sort order of the module list on the search screen was not sorted alphabetically	This was a bug introduced into 5.2.3. Now fixed.
37951	Product Bug	5.0	Administration	An ampersand in the title of a business area or project was not rendered correctly	This has been corrected.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
58600	Product Bug	5.2.1	Administration	Display problem in Screen and report layout editor with the field EV_REPORT_SELECTION	If this field was given a very long title, there would be insufficient room on the screen for the field in the layout editor. This has been fixed by giving the field a much shorter title.
58657	Product Bug	5.0.2.4	Administration	Confusing information displayed when more than one project has the same title within different business areas	This was a minor issue where the internal ID of the projects that were duplicates were displayed, as opposed to their titles. This has been fixed so that in the rare occasions when more than one project has the same name, the user will see something like Business Area Title.Project title.
59329	Product Bug	5.2.3.2	Administration	The expire user password immediately checkbox was not operational	This was fixed.
60426	Product Bug	5.2.3.2	Administration	USER_SELF_REGISTRATION required the intervention of an administrator to set the business area and project of the new user	The operation of the USER_SELF_REGISTRATION feature has been modified such that a user who self-registers will be given the default business area and project of the ADMIN user account. This simplifies the self registration process as new users no longer must be validated by an administrator.
56714	Product Bug	5.2.2	Allowed Values	Allowed Values on Query page did not work until screen was refreshed	This was fixed.
58519	Product Bug	5.2.3.1	Allowed Values	Allowed value list lost filtering when returning to condensed/standard screen from creating a report	This was an obscure problem that was fixed. This had little effect on users who noticed the discrepancy, as they simply reset the filters on the report.
62250	Product Bug	6.0	Allowed Values	Deleting list values when there's an allowed value relationship did not make the changes visible immediately	If a value in a list that was tied to an allowed value list was deleted, then the value was still visible in the user interface until the server was restarted. This was traced to a caching problem of JavaScript, and has been repaired.
60887	Product Bug	5.2.3.2	Attachments	Attachment metadata was not set correctly on clone of an issue and using the file system to store the attachments	When a user cloned an item with attachments stored on the filesystem, the EXTERNAL_IDENT database column was not populated with the value from the original item. This led to attachments that could not be viewed as the content could not be found. This was fixed
56810	Product Bug	5.2.3	Database	Radio button could not be a parent or child of an alias relationship	This has now been implemented to work the same as all other list type fields.
58599	Product Bug	5.2	Database	Links from Home Page reports were not generated on old reports generated on version 4.0 and before	When sites updated directly from versions at the 4.0.x level to the most recent version of code, reports would not be able to be seen from user's Home Pages. This has been fixed.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
56315	Product Bug	5.1	General code issues	With LDAP enabled, users in the Guest role were populating the Assigned To and Owner fields	This caused additional entries in these fields, even though these users should not be part of the process without a suitable license.
60098	Product Bug	5.2.3	Interest Lists	Could not delete a user from Interest List if the User ID contains a dash	Now fixed.
56369	Product Bug	5.2.2	Internationalization	Date format displayed incorrectly with 24 hour format in non-english locales	This has been fixed.
59357	Product Bug	5.2.3.1	Internationalization	Date Format displayed incorrectly in French (Canada) language	This was fixed.
56313	Product Bug	5.2	LDAP	A null pointer was seen when LDAP_USER_LOOKUP = YES and USER_LIST_DISPLAY=LIST	When LDAP_USER_LOOKUP=YES and USER_LIST_DISPLAY=LIST, the Query page generated the following error message and user fields were not rendered correctly: Error rendering form: see log for details.null This error did not happen if USER_LIST_DISPLAY=POPUP. This was fixed.
57246	Product Bug	5.2.2	Mass Update	Mass Update sometimes would cause the user's session to expire	This was a bug and has been fixed.
59349	Product Bug	5.2.3	Perforce Integration	Perforce Error Log Message is incorrect	During a EVP4D install a specific section of the error handling was incorrect. After attempting to start the Perforce Daemon I noticed an error message stating "evid does not exist in ExtraView." The problem was that the evid was not added to the Perforce Jobspec, so the error message should have been "evid does not exist in Perforce." The message now says "does not exist in Perforce".
59684	Product Bug	5.2.2.2	Perforce Integration	A space character in the P4 directory name caused a problem	Perforce files and depot paths with embedded blanks are now supported. This was a bug in the Perforce p4package code.
62816	Product Bug	5.2.3.3	Perforce Integration	Perforce integration gave "java.io.EOFException: Premature EOF encountered" errors in the log	An exception appeared in the log when transactions were processed. This did not affect the processing of the updates. The error has been trapped and is no longer displayed.
52422	Product Bug	5.2	Performance	Sorting of large lists of allowed values has been speeded up	This is a performance improvement that will speed up the production of allowed value lists for all users.
57589	Product Bug	5.2.3	Rules Engine	The rules += operator on SYSDAY did not work when the User's personal date format included a timestamp	This has been fixed.

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
57983	Product Bug	5.2.3	Rules Engine	Rules did not work with radio buttons	<p>Radio buttons have slightly special treatment to prevent the <== refresh ==> rule being triggered when the user clicks on the value that is already chosen. In this case, use two HTML_MODIFIER's of the form:</p> <pre>onclick = blur('p_my_field_name'); onchange = submitChange('p_my_field_name');</pre> <p>However, if you are not concerned about the firing of the rules when a user clicks the value on a radio button, as simpler form is a single radio button:</p> <pre>onclick = submitChange('p_my_field_name');</pre>
48764	Product Bug	5.0.2.5	Search / Report	FILTER_CHILD_VALUES caused java.lang.reflect.InvocationTargetException	<p>The root cause of this bug was using FILTER_CHILD_VALUES on the Search screen layout with an incorrect setting of FILTER_CHILD_VALUES in its behavior setting. This has been fixed. In order to use FILTER_CHILD_VALUES on the search layout, you also need to set the Behavior Setting FILTER_CHILD_VALUES to USER. Go to Admin --> System Controls --> All Behavior Settings and find FILTER_CHILD_VALUES - if it is set to NO, you will get the InvocationTargetException, if it is set to YES, you will always filter on child values, and if it is set to USER, it will respect the checkbox.</p>
50811	Product Bug	5.2	Search / Report	Oracle Exception fixed when adding drilldown links to custom reports	<p>This was a rare occurrence when a custom report was built with a drilldown through the ID field. Now fixed.</p>
52740	Product Bug	5.1.3	Search / Report	Very large reports did not return all the records	<p>Irrespective of the value of LIMIT_QUERY_ROWS, ExtraView would not return more than 10,000 rows in a query. This was due to a single point in the code where 10,000 was hard-coded, although it was only intended to be the default value of LIMIT_QUERY_ROWS.</p>
54168	Product Bug	5.2.1	Search / Report	Advanced Query did not return expected issues	<p>This was traced to the "not in" operator not being handled correctly when the query was being parsed. Now fixed.</p>
56650	Product Bug	5.2.2	Search / Report	Saved summary reports did not always drill down to the correct issues	<p>This was a bug that occurred infrequently, depending on which fields were placed on the summary report. This has been fixed.</p>

Release Notes					
Issue #	Category	Found In Release	Module	Title	Release Note
56651	Product Bug	5.2.1	Search / Report	Non-alphanumeric characters are stripped from the end of field titles	A customer had created a UDF field by pasting its title into the field from an external document. This caused a tab character at the end of the title to become part of the title. This was innocuous until a user prepared a report with this field and exported the report to Microsoft Excel. The tab character then caused a mis-alignment of the data within the Excel spreadsheet.
57994	Product Bug	5.2.3	Search / Report	Warning message about needing more filters occurred on the Query screen no matter the value of MINIMUM_SEARCH_FIELDS	This only occurred if the first filter chosen by the user was KEYWORD. This bug has been fixed.
58529	Product Bug	5.2.2.2	Search / Report	Query returned wrong result when "Days Created Since(DATE_CREATED_SINCE) equals" is set as a query filter with the "and" conjunction	This filter condition did not return the expected results. Now fixed.
58939	Product Bug	5.2.3	Search / Report	Column report with promoted group headings did not sub-total all columns correctly	This was caused when the user did not promote the first sorted field, but promoted the second, third or fourth sort field. This was not a valid use case, and so the program has been altered to not allow the promotion of sort fields out of sequence, beginning with the first one.
60004	Product Bug	5.2.3	Search / Report	When reporting repeating rows columns not displayed when filtering with a union conjunction	This scenario is only used rarely, but it now works correctly.
62463	Product Bug	6.0	Search / Report	Home Page reports did not respect the behavior setting of FILTER_CHILD_VALUES	This was a bug that was fixed.
51296	Product Bug	5.2.3	User Custom	Email format did not check for .info type email addresses	Only 3 character suffixes such as .com and .net were being checked
60614	Product Bug	5.2.3.3	User Custom	New JavaScript method to allow alternative printing method to be defined for the Add or Edit screens	There is a new, optional UserJavaScript.js method named printAddEditPage(). This is only triggered in the Add and Edit screens. When the user presses the Print Page button in the ExtraView menubar, code in this method can provide a replacement to the standard window.print() method used by the browser. This often does not format the screen well, and so this method provides a hook to replace the standard browser functionality.
48085	Product Bug	5.1	Zapatec	Could not place JavaScript inside an HTML AREA field	This was implemented deliberately to prevent users from introducing malicious scripts onto pages. We have relaxed the restriction for the HTML AREA that is used to display the sign on message, as only the administrator may edit that field.
56725	Product Bug	5.2.1	Zapatec	Dates were sometimes shown as invalid When using the French / Canadian locale	This has been fixed and should now work correctly for all dates.
